Modeling AP risk at retail scale

Illustrative modeling on public data. Not affiliated with, endorsed by, or commissioned by the named company. No dollar figure was identified in its actual books — projections apply published benchmarks to stated assumptions.

Modeled AuditLedger against Walmart Inc.'s publicly reported AP scale (~5,000,000 invoices/yr, assumed): a 100%-auditable control addressing an industry-benchmarked \$3.9B-\$9.7B/yr in duplicate-payment leakage and ~\$37.5M in manual processing cost — every dollar traceable to a logged decision.

Assumptions		Modeled results	
Company (public)	Walmart Inc.	Measured catch rate (real run)	100%
Annual revenue (public)	\$648.1B	Measured automation rate (real run)	60%
Cost-of-sales ratio	75%	Processing cost addressable	\$37.5M
Modeled AP spend	\$486.1B	Duplicate leakage addressable*	\$3.9B–\$9.7B
Suppliers (public)	100,000+	Estimated hours saved	500,000
Invoices/supplier/yr (assumed)	50	Audit coverage	100%
Modeled invoice volume	5,000,000/yr		

*Published 0.8–2% duplicate-payment benchmark applied to modeled AP spend — an addressable range, not a figure found in any company's books.

Source: Walmart FY2024 10-K (fiscal year ended Jan 31, 2024): total revenue ~\$648.1B; cost of sales ~75% of revenue; "100,000+ suppliers" widely reported. Publicly reported figures — verify against the latest 10-K.

Illustrative analysis using synthetic data scaled to publicly reported figures. Not affiliated with, endorsed by, or commissioned by the named company. No dollar figure was identified in that company's actual books; projections apply published industry benchmarks to stated assumptions.
